

Safety Inspection prior to Operation of Vehicle-type Construction Machinery

- It's a MUST, not an Option. -

Recently, drivers suffered fatalities when vehicle-type construction machinery* (i.e. dump trucks and excavators) collapse. Safety inspection prior to operation is critical in order to prevent such tragic accidents.

* (Vehicle-type construction machinery) Construction machinery capable of independently moving to unspecified locations by means of an energy source (Article 196 of the Local Rule of Occupational Safety and Health Standard)

Cases of Accidents

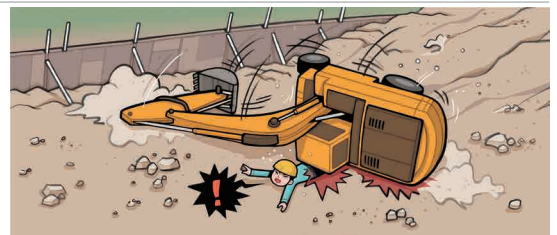

Summary of Accident

At the construction site of land development for housing located in Seo-gu, Incheon on Wednesday, March 31, 2021, a dump truck entering into the unloading site to deliver earth and sand suddenly lost its left rear wheel. But when the truck lifted its cargo compartment without the lost wheel and proceeded with unloading work, it eventually overturned to the left and collapsed upon the driver who was trying to escape but got caught between the vehicle and the ground.

On Friday, April 2, 2021, while an excavator was transporting concrete with its bucket for the purpose of concrete cast work for the foundation of the dam located in Changnyeong, Gyeongsangbuk-do, the vehicle fell over due to the ground failure, which caused the driver to be thrown from the driver's seat and pinned beneath the excavator.

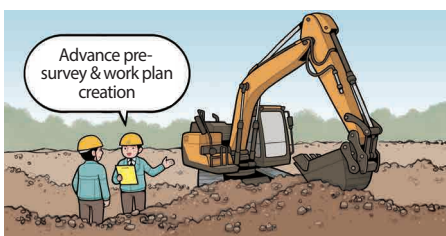

At the construction site located at Okcheon-gun, Chungcheongbuk-do on Monday, April 26, 2021, during the operation of spreading ascon with shovels, a worker collided with a dump truck backing up for additional supply of ascon, fell down on the ground to get his lower body trapped under the right rear wheel and was eventually killed.

Situation Map of Accident

Accident Prevention Measures

Pre-survey and Work Plan Creation

Designation of Supervisor

Wearing of Safety Belt (Recommended)

Key Matters to Verify with Vehicle-type Construction Machinery

- (Matters to Check prior to Use) Establishment of work plan prior to use, verification of topography and ground condition at the work site, examination of performance and capability of construction machinery, preventive measures for subsidence and collapse of soft ground, fact-finding investigation of underground facility.
- (Matters to Check during the Use) Access prohibition within the operating radius, restriction on the usage other than the given uses, compliance with safety regulations by drivers and workers, prohibition of simultaneous upper/lower operation, verification of signal methods and location of signaler.
